Chapter XX

Tensor analysis using indices - Senovilla et al. - Shearfree for dust

if $\sigma_{ab}=0 \Rightarrow \omega\Theta=0$

Author: Peter Huf

file 1

Introduction

The theorem $\sigma_{ab}=0 \Rightarrow \omega\Theta=0$ has been shown using tetrads. There is no complete proof using a 1+3 covariant formalism.

In this file we follow the equations outlined by

Senovilla, J.M.M., Sopuerta, C.F., Szekeres, P. Theorems on shear-free perfect fluids with their Newtonian analogues, Gen.Rel.Grav, 30, 389-411 (1998)

with the assumptions for dust
i.e p=0, du=0, shear=0, viscosity=0

1. General results

```
*****
```

Equation 1 (SSSeq1)

```
*****
```

The energy stress tensor for a perfect fluid reads:

$$\begin{aligned} > ET_PF := T[-a, -b] = \rho \cdot u[-a] \cdot u[-b] + p \cdot P[-a, -b] : T(ET_PF); \\ T_{ab} = \rho u_a u_b + P p_{ab} \end{aligned} \quad (2.1)$$

where for dust, p=0, and so

$$\begin{aligned} > eq[1] := subs(p=0, ET_PF) : T(eq[1]); \\ T_{ab} = \rho u_a u_b \end{aligned} \quad (2.2)$$

where

u_a is the unit velocity vector field

ρ = energy density

p = pressure

```
*****
```

Equation 2 Projection tensor and identities (SSSeq2)

>

The projection tensor, P, is defined as:

$$\begin{aligned} > \text{deg}[1] := P[-a, -b] = g[-a, -b] + u[-a] \cdot u[-b] : T(\text{deg}[1]); \\ & \qquad \qquad \qquad P_{ab} = u u_{ab} + g_{ab} \end{aligned} \quad (2.3)$$

$$> \text{eq}[2] := \text{deg}[1] :$$

P_{ab} defines the projection tensor, the projector orthogonal to \mathbf{u} .

i.e. P_{ab} creates the component of \mathbf{u} in the direction of \mathbf{b} .

>

There are several properties that can be proved from the definition at this point.

We use known identities:

$$\begin{aligned} > \text{id}[1] := u[a] \cdot u[-a] = -1 : T(\text{id}[1]); \\ & \qquad \qquad \qquad u^a u_a = -1 \end{aligned} \quad (2.4)$$

$$\begin{aligned} > \text{id}[2] := g[a, -a] = 4 : T(\text{id}[2]); \\ & \qquad \qquad \qquad g^a_a = 4 \end{aligned} \quad (2.5)$$

2a. Symmetry of the projection tensor:

$$\begin{aligned} > \text{deg}[1] : T(\text{deg}[1]); \\ & \qquad \qquad \qquad P_{ab} = u u_{ab} + g_{ab} \end{aligned} \quad (2.6)$$

Due to the symmetry of g , we can see immediately that

$$\begin{aligned} > \text{deg}[2b] := P[-a, -b] = P[-b, -a] : T(\%); \\ & \qquad \qquad \qquad P_{ab} = P_{ba} \end{aligned} \quad (2.7)$$

Equations 3abc Other properties of the projection tensor (SSSeqs3abc)

We prove several simple identities related to P :

Firstly we aim to prove SSSeq3b

$$\begin{aligned} > P[a, -a] = 3 : T(\%); \\ & \qquad \qquad \qquad P^a_a = 3 \end{aligned} \quad (2.8)$$

Commencing with the original identity:

$$\begin{aligned} > T(\text{deg}[1]); \\ & \qquad \qquad \qquad P_{ab} = u u_{ab} + g_{ab} \end{aligned} \quad (2.9)$$

We raise the index a:

$$\begin{aligned} > \text{deq}[1b] := \text{raise}(\text{deq}[1], a) : T(\%); \\ & P^a_b = u^a u_b + g^a_b \end{aligned} \quad (2.10)$$

and then contract a on b:

$$\begin{aligned} > \text{deq}[1c] := \text{contract}(\text{deq}[1b], b, a) : T(\%); \\ & P^b_b = u^b u_b + g^b_b \end{aligned} \quad (2.11)$$

We substitute the velocity and metric identities:

$$\begin{aligned} > \text{deq}[1d] := \text{TELS}(\text{id}[1], \text{deq}[1c]) : T(\text{deq}[1d]); \\ & P^b_b = -1 + g^b_b \end{aligned} \quad (2.12)$$

$$\begin{aligned} > \text{deq}[1e] := \text{TELS}(\text{id}[2], \text{deq}[1d]) : T(\%); \\ & P^b_b = 3 \end{aligned} \quad (2.13)$$

>

We move to SSSeq3a

$$\begin{aligned} > \text{SSSeq3a} := P[a, -b] \cdot P[b, -c] = P[a, -c] : T(\%); \\ & P^a_b P^b_c = P^a_c \end{aligned} \quad (2.14)$$

We start with the LHS:

$$\begin{aligned} > \text{deq}[3a] := P[a, -b] \cdot P[b, -c] : T(\%); \\ & P^a_b P^b_c \end{aligned} \quad (2.15)$$

Substituting identities:

$$\begin{aligned} > \text{deq}[3b] := \text{TEDS}(\text{deq}[1b], \text{deq}[3a]) : T(\%); \\ & P^b_c (u^a u_b + g^a_b) \end{aligned} \quad (2.16)$$

$$\begin{aligned} > \text{deq}[3d] := \text{TELS}(\text{deq}[1b], \text{deq}[3b]) : T(\%); \\ & (u^a u_b + g^a_b) (u^b u_c + g^b_c) \end{aligned} \quad (2.17)$$

$$\begin{aligned} > \text{deq}[3e] := \text{expand}(\text{deq}[3d]) : T(\%); \\ & u^a u^b u_b u_c + g^a_b u^b u_c + g^b_c u^a u_b + g^a_b g^b_c \end{aligned} \quad (2.18)$$

$$\begin{aligned} > \text{deq}[3f] := \text{Absorb}(\text{deq}[3e]) : T(\%); \\ & u^a u^b u_b u_c + 2 u^a u_c + g^a_c \end{aligned} \quad (2.19)$$

$$\begin{aligned} > \text{id}[1b] := u[-b] \cdot u[b] = -1; \\ & \text{id}_b := u_b u_{-b} = -1 \end{aligned} \quad (2.20)$$

$$\begin{aligned} > \text{deq}[3g] := \text{TEDS}(\text{id}[1b], \text{deq}[3f]) : T(\%); \\ & u^a u_c + g^a_c \end{aligned} \quad (2.21)$$

leads to

by definition, this is P^a_c

So we add to the array of equations

$$\begin{aligned}
 > \text{deq}[3h] := P[a,-c] = P[a,-b] \cdot P[b,-c] : T(\%); \\
 & \qquad \qquad \qquad P^a_c = P^a_b P^b_c
 \end{aligned}
 \tag{2.22}$$

Now we try to show equation 3c: $u^b P^a_b = 0$

$$\begin{aligned}
 > \text{deq}[3c] := \text{deq}[1b] \cdot u[b] : T(\%); \\
 & \qquad \qquad \qquad u^b P^a_b = u^b (u^a u_b + g^a_b)
 \end{aligned}
 \tag{2.23}$$

$$\begin{aligned}
 > \text{deq}[3c] := \text{expand}(\text{deq}[3c]) : T(\%); \\
 & \qquad \qquad \qquad u^b P^a_b = u^a u^b u_b + g^a_b u^b
 \end{aligned}
 \tag{2.24}$$

$$\begin{aligned}
 > \text{deq}[3c] := \text{Absorb}(\text{TEDS}(\text{subs}(a=b, \text{id}[1]), \text{deq}[3c])) : \text{eq}[3] := \text{deq}[3c] : \\
 & \qquad \qquad \qquad T(\text{deq}[3c]); \\
 & \qquad \qquad \qquad u^b P^a_b = 0
 \end{aligned}
 \tag{2.25}$$

which proves the equation 3c.

>

Equation 4- Definition of a time derivative of a tensor

For any vector X, the time derivative

$$\begin{aligned}
 > \text{eq}[4] := dX[a] = u[b] \cdot X[a,-B] : T(\%); \\
 & \qquad \qquad \qquad dX^a = u^b X^a_{;b}
 \end{aligned}
 \tag{2.26}$$

This can apply to any tensor. S

See application to acceleration in eq5

Equation 5 Definition of acceleration

We move now to various definitions, firstly for acceleration, du:

$$\begin{aligned}
 > \text{eq}[5] := du[a] = u[b] \cdot u[a,-B] : T(\%); \\
 & \qquad \qquad \qquad du^a = u^b u^a_{;b}
 \end{aligned}
 \tag{2.27}$$

and now for various kinematic quantities and relationships:

Equation 6 Decomposition of covariant derivative of velocity

>

```
> eq[ 6 ] := u [ -a, -B ] = ( 1/3 ) · theta · P [ -a, -b ] + sigma [ -a, -b ] + omega [ -a, -b ]
      - du [ -a ] · u [ -b ] : T( % );
      u_{a;b} = 1/3 θ P_{ab} + σ_{ab} + ω_{ab} - du_a u_b
```

(2.28)

The proof is important and widely used, but is common in the literature and will not be formally proved at this point (for a detailed proof see see Ellis (1970)).
